

Abstract Amendments

Amend the abstract by rewriting the paragraph at page 43, lines 2-17, as follows:

A system for modular construction comprising a plurality of structural members. Each of the plurality of structural members comprises a first lengthwise side and a second lengthwise side opposite the first lengthwise side. Each of the lengthwise sides are generally parallel to each other. Each of the plurality of structural members also comprises a first widthwise side and a second widthwise side opposite the first widthwise side. Each of the widthwise sides are generally parallel to each other. Each of the plurality of structural members also comprises at least two slots along one of said lengthwise sides. Each of the slots comprise a pair of generally parallel slot sides, an open end along one of the lengthwise sides, a slot axis parallel to and disposed equally between the slot sides. A first one of the at least two slots defines a first outside slot which is located nearest to the first widthwise side and a second one of the at least two slots defines a second outside slot which is located nearest to the second widthwise side. The distance between the slot axis of the first outside slot and the first widthwise side is a predetermined slot-to-side distance, and the distance between the slot axis of the second outside slot and the second widthwise side is a whole-number multiple of the predetermined slot-to-side distance. The distance between each of the slot axes of the at least two slots along one of said lengthwise sides is a whole-number multiple of the predetermined slot-to-side distance. Each of the at least two slots along one of the lengthwise sides of one of the plurality of structural members is detachably and selectively connected slot-to-slot to one of all of the at least two slots along one of the lengthwise sides of each of the other of the plurality of structural members.
